Keysight E5250A

Low Leakage Switch Mainframe

Introduction

The Keysight E5250A low-leakage switch mainframe expands a single measurement station, such as the Keysight B1500A, E5270B, 4155C, or 4156C, to an automated measurement system. Plug-in modules can be configured either as a cross-point matrix for general parametric measurements or as a multiplexer for long-term reliability measurements.

When configured as a 10 x 12 Matrix Switch, the E5250A is ideal for general IV-CV parametric measurements with up to x48 triaxial output configurations.

Because of its 384 channel capability and advanced features that are typically found only on larger, more expensive input devices, the E5250A is ideal for long-term reliability measurements when configured as a 24 (8 x 3) Channel Multiplexer. This enables the use of low-cost power supplies for consistent stressing.

A large number of channels and low-cost stress sources allow the parallel testing of hundreds of devices, saving cost and time and achieving accurate, consistent results.

Basic Functions

Keysight Technologies, Inc. E5250A Low Leakage Switch Mainframe functions:

- Switches DC current, DC voltage, capacitance, and pulse with DC instruments and LCR meters
- · Controls switching through built-in GPIB
- · Performs self-test using Option 301 relay function test adapter

Configurations

- E5252A 10 x 12 matrix switch: From 10 x 12 to 10 x 48 matrix per frame. (E5252A x 1 to 4)
- E5255A 24-channel (8 x 3) multiplexer: From 24 to 96 channels per frame (E5255A x 1 to 4)
- Required cables and connector plates are available.

Specification

The Supplemental Information and Typical Data entries in the following specifications are not warranted, but they provide useful information about the functions and performance of the instruments. Specifications, typical data, and supplemental information are defined at 23° C \pm 5° C < 60% relative humidity (RH).
